FRIDAY TALK · REDLENS + PEDAXIS

Keeping a Platform Alive

From Slack signal to validated delivery

01 · CONTEXT

Feedback moved closer to the conversation.

ORIGINAL IDEA

In-product

- A dedicated feedback page within the product, with a floating button on the right side to create new reports.
- No integration with the development team's daily workflow.
- The need to develop a new page and additional features within the platform just to keep reports organized.

CURRENT WORKFLOW

Conversation-driven

- The feedback process starts in the main platform the team uses every day.
- Tickets are automatically added to the board and become part of the team's daily workflow.
- Everything stays threaded and contextualized in Slack.

02 · INTAKE

Slack is the feedback surface.

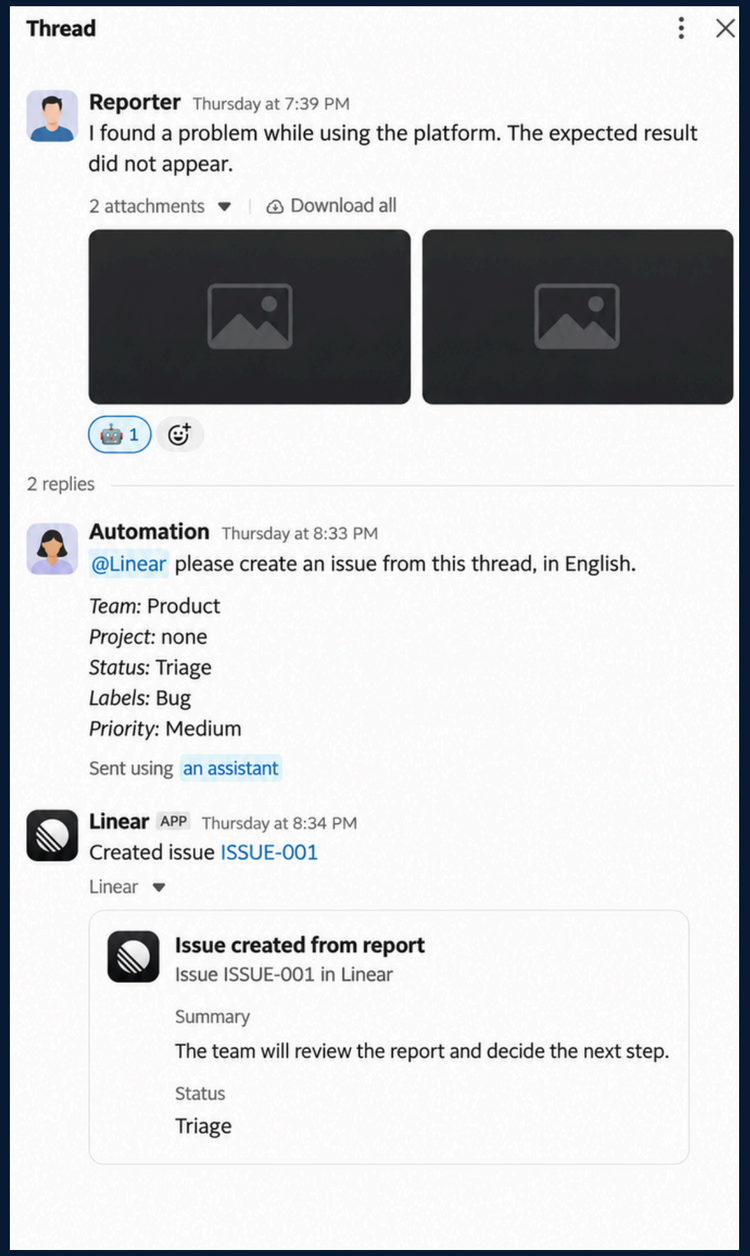

The intake layer wins because it preserves urgency, nuance, and the people already in the room.

01 Zero context switching

02 Follow-up stays threaded

03 Signals are visible to the team

04 Every new message update the ticket context

03 · SIGNAL

A useful report carries four things.

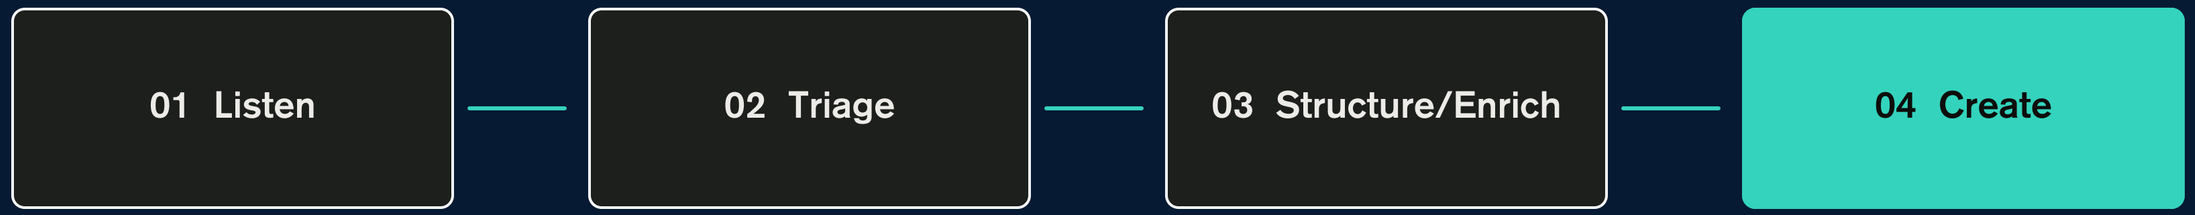

REPORTING SIGNAL

What the report contributes

01	**Observation**	What happened — without diagnosis.
02	**Context**	Who, where, and under what conditions.
03	**Impact**	Why the issue matters now.
04	**Evidence**	A thread, capture, trace, or reproducible clue.

04 · AUTOMATION

Automate the handoff, not the judgment.

Capture structure automatically. Keep priority and commitment human.

05 · SAME PRINCIPLE

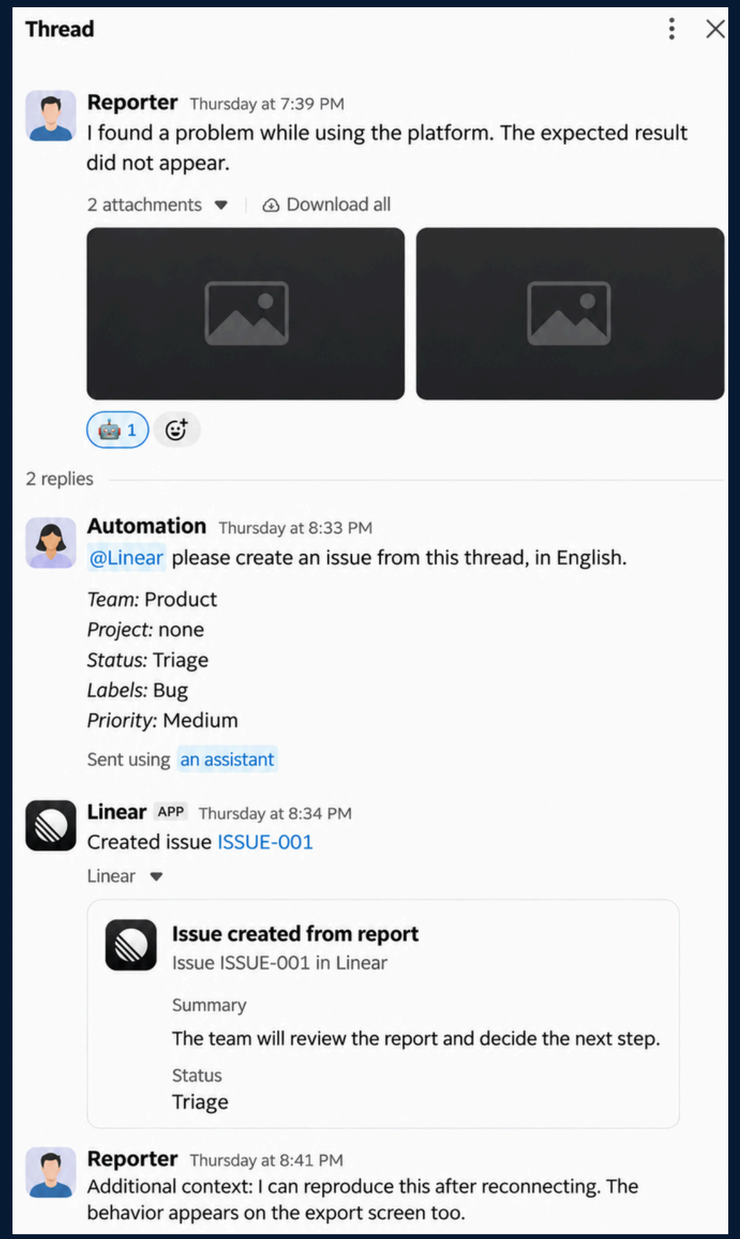

Two flows. One operating principle.

OPERATING STEP	REDLENS	PEDAXIS
Intake	**Slack thread**	**Slack thread**
Decision record	**Linear issue**	**Linear issue**
Delivery	**RedLens harness**	**Pedaxis gate**
Close	**Reply + evidence**	**Approval + evidence**

06 · CONTEXT

The thread becomes living context.

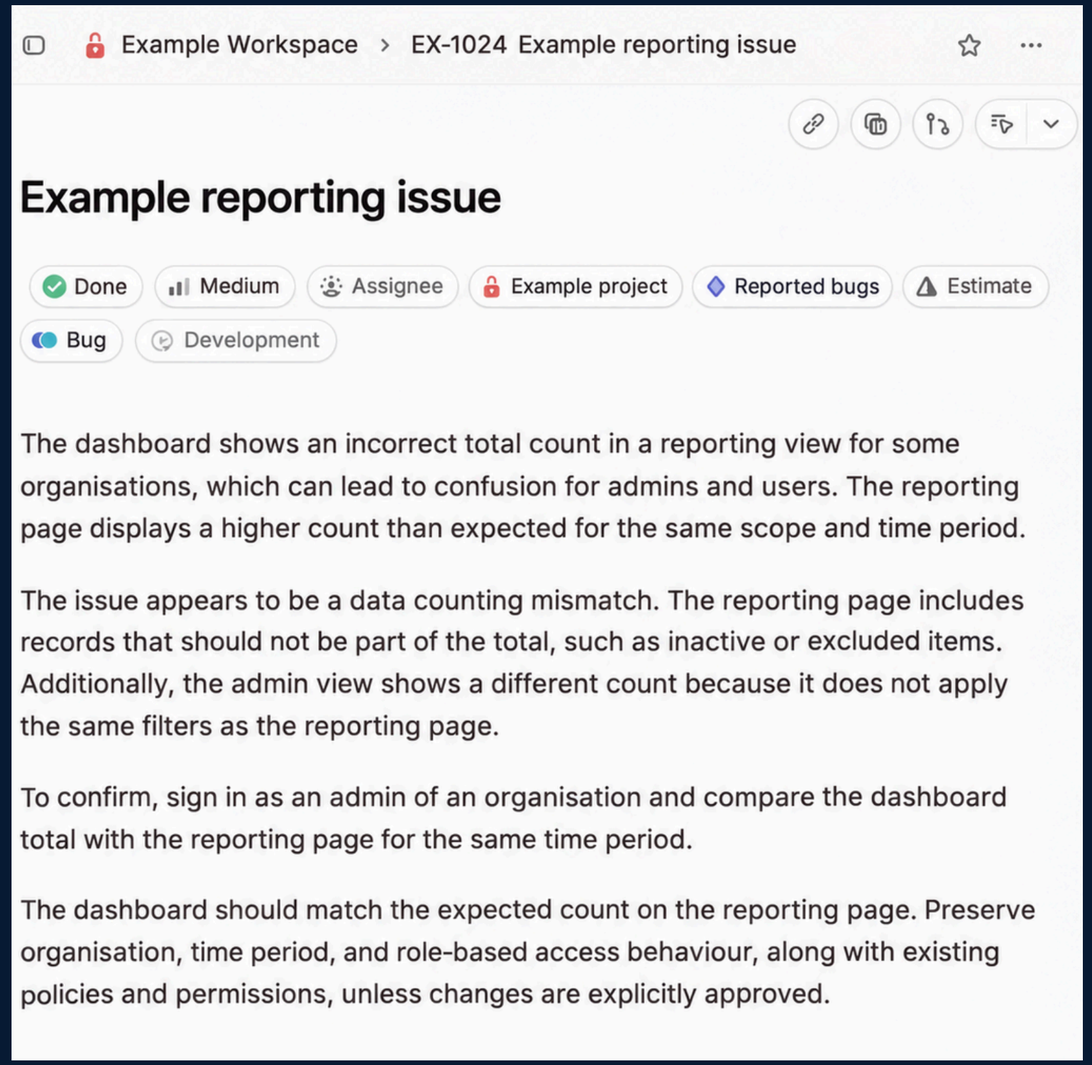

- Signal appears
- Clarifying questions
- Decision is linked
- Outcome returns

07 · DECISION

Linear is the decision record.

ASSIGNEE	One accountable person
SCOPE	A bounded change
STATE	The current commitment
EVIDENCE	What proves closure

08 · ROUTING

Triage turns a report into a decision

Input	Triage check	Decision
Report + thread	Impact and urgency	Fix now or investigate
Evidence	Enough to reproduce?	Ask for context
Existing issue	Duplicate or new?	Link or create
Feature request	Value and scope	Plan or backlog

09 · GATE

Estimate, develop, approve, commit

01

Estimate

Size scope, effort, and risk

02

Develop

Build the scoped change

03

Approve

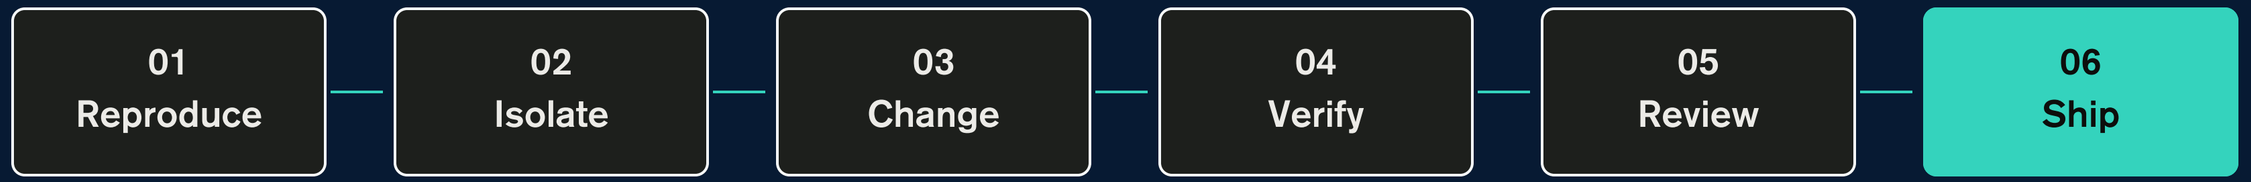

Review the implementation

04

Commit

Set the delivery commitment

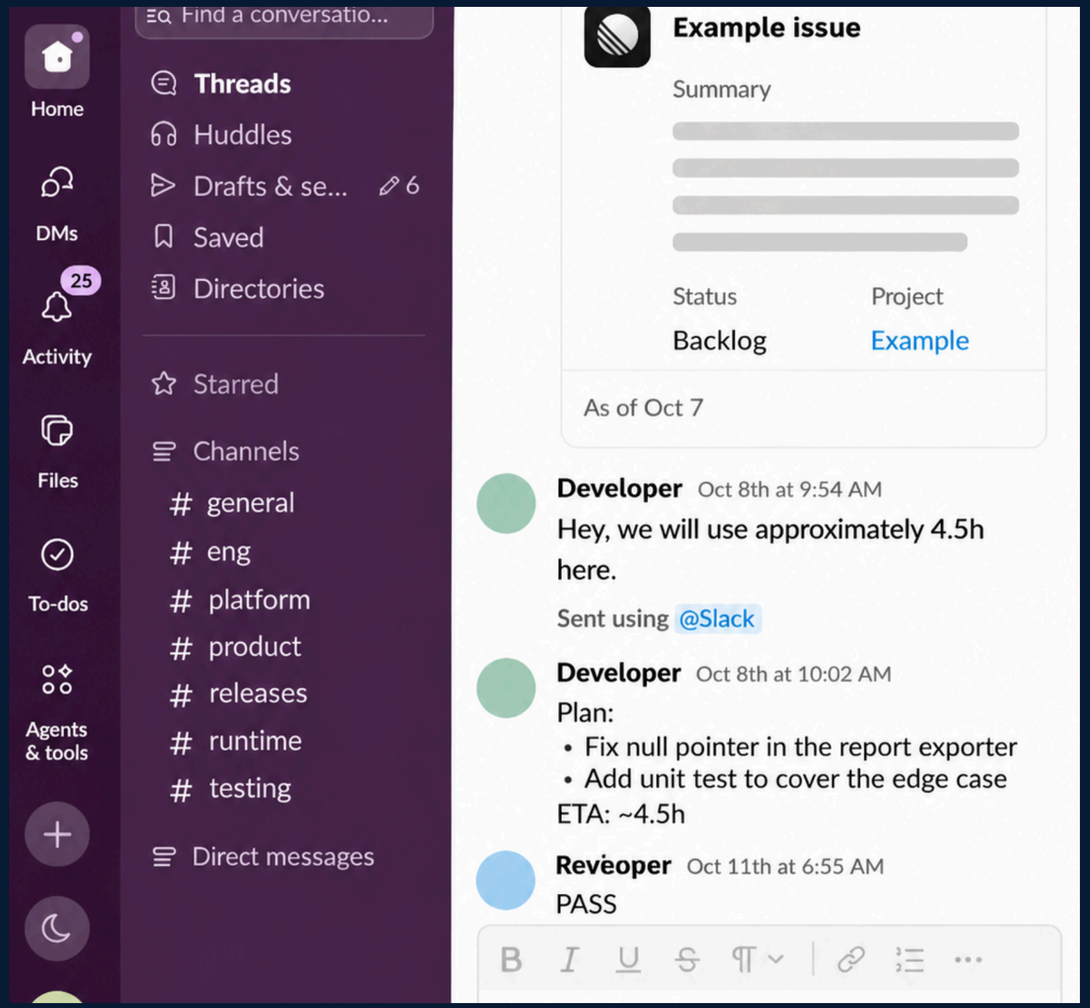

Before shipping a fix

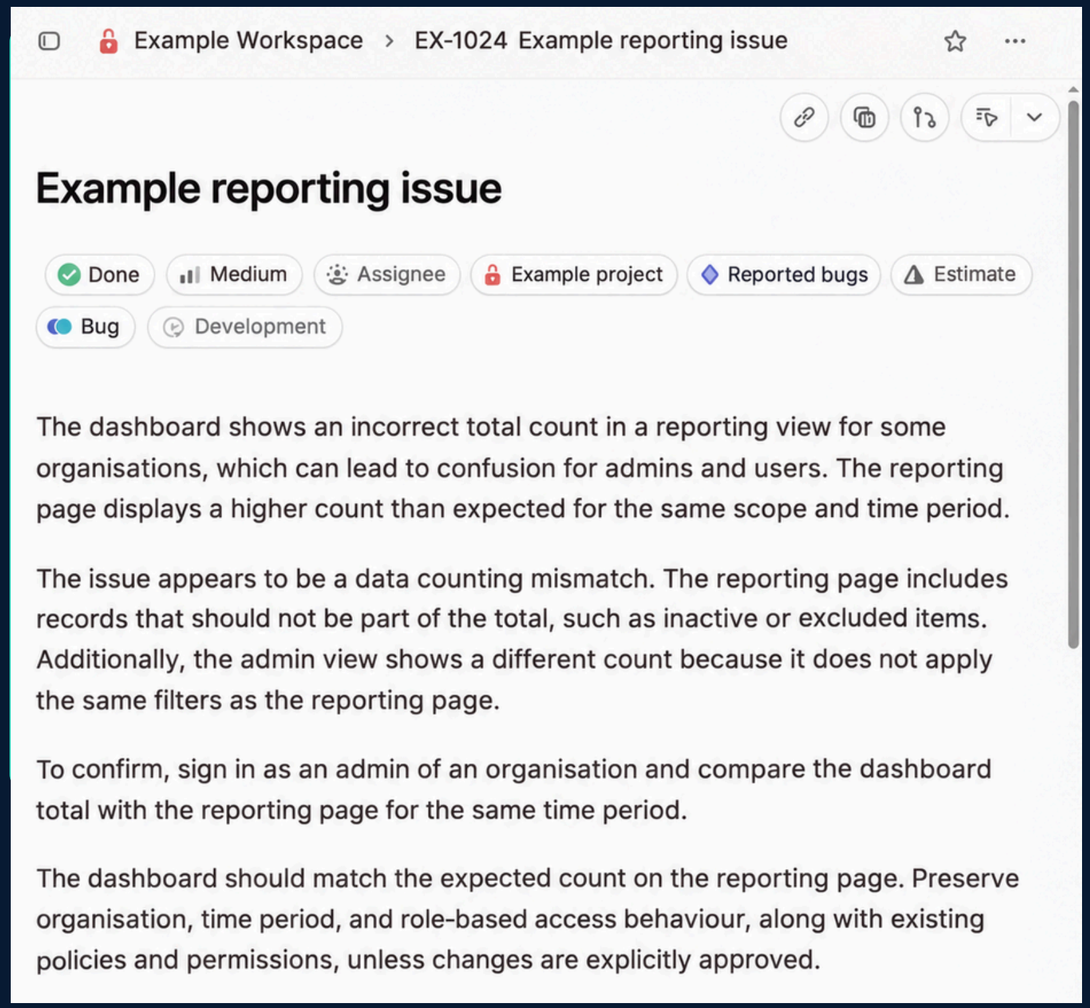

The report reproduces. Tests pass. Review confirms the change.

Closure is visible at both ends.

SLACK · CONVERSATION

LINEAR · RESOLVED ISSUE

Automation pauses where judgment matters.

01

PRIORITIZE

Is this worth doing now?

02

APPROVE

Is this the right scope?

03

ACCEPT

Does the evidence close the loop?

THE OPERATING LOOP

Listen.
Decide. Deliver.
Return with evidence.

A platform stays alive when every release improves the next conversation.
